RIVERBEND PAIN SPECIALISTS - PROCEDURE NOTE
Patient: Morgan Ellis DOB: 04/11/1985
Date of Service: 03/17/2026 Physician: Daniel Weiss, MD

PROCEDURE: Cervical interlaminar epidural steroid injection, C6-C7, under fluoroscopic guidance.
PRE-PROCEDURE DIAGNOSIS: Cervical radiculopathy secondary to C5-C6 disc protrusion.
POST-PROCEDURE DIAGNOSIS: Same.
PRE-PROCEDURE PAIN SCORE: 7/10.

DESCRIPTION OF PROCEDURE:
On 03/18/2026 the patient was brought to the procedure suite after informed consent was obtained and
placed prone. The posterior neck was prepped and draped in sterile fashion. Using fluoroscopic guidance, an 18-gauge Tuohy needle was advanced at the C6-C7 interlaminar space using the loss of
resistance technique. Epidural spread was confirmed with 1 mL of contrast. A mixture of 80 mg triamcinolone and 4 mL of preservative-free normal saline was injected without difficulty.

The needle was removed and a bandage applied. There were no complications. Estimated blood loss minimal.

POST-PROCEDURE: Patient tolerated the procedure well. Vital signs stable. Post-procedure pain score
4/10. Discharged home with a driver after 30 minutes of observation.

INSTRUCTIONS: No driving for the rest of the day. Ice to the injection site as needed. Pain diary for
2 weeks. Follow up in 3 weeks.

Electronically signed: Daniel Weiss, MD 03/17/2026
